Histamine, synthesized in the brain, mediates diverse functions through four known receptor subtypes: the H1 and H2 receptors are stimulated by histamine itself; and the H3 and H4 receptors are stimulated by histamine-related compounds (epinastine, thioperamide, imetit). The H2 receptor is the second-most abundant histamine receptor in the brain. In the rat, cDNA encoding the H2 receptor has been cloned and sequenced. We have now isolated human cDNA encoding this histamine receptor and determined its nucleotide sequence. This is the first nucleotide sequence determination for a histamine receptor subtype in humans. The predicted amino acid sequence of the H2 receptor is 99% identical to the rat sequence.HELMSLEY, R.
