1. Field of the Invention The present invention relates generally to a variable-frequency oscillator, and more particularly to a variable-frequency oscillator with feedback in which voltage-controlled oscillators (VCOs) are used.

2. Description of the Related Art FIG. 1 is a circuit diagram showing one prior-art variable-frequency oscillator. In the figure, numeral 1 represents an oscillator, which includes coils 1a and 1b, a condenser 1c and a control voltage-applying terminal 1d. Numeral 2 represents a capacitor with a predetermined capacitance, numeral 3 represents an inverter circuit that consists of an NPN transistor 3a and a PNP transistor 3b, numeral 4a represents an oscillating transistor, numeral 4b represents a drive transistor and numeral 4c represents a current-driven circuit. The VCO 1 oscillates using an LC resonance circuit consisting of the capacitor 2 and the coil 1b, the oscillating transistor 4a being controlled by the control voltage-applying terminal 1d of the oscillator 1. The VCO 1 then oscillates at a predetermined frequency.

FIG. 2 is a circuit diagram showing the inverter circuit 3 of FIG. 1, in which a diode 3e is used to increase the gain of the amplifier 3c. The circuit 3 provides a phase of about 45 degrees when the current-driving circuit 4c is turned on and the current-driving circuit 4c is turned off. When a constant voltage $V_{sub.s}$ is applied to the terminal 1d, the oscillator 1 oscillates at a predetermined frequency F , as mentioned above. However, if the control voltage $V_{sub.c}$ applied to the terminal 1d fluctuates, the oscillator 1 also fluctuates. The oscillation frequency of the oscillator is thus dependent on the voltage $V_{sub.c}$. As described above, the variable-frequency oscillator of FIG. 1 supplies a constant current to the current-driven circuit 4
